"The Prevention of Transfusion Hepatitis."

Budapest, Orvosi Hetilap, Vol 104, No 17, 28 Apr 63, pages 780-782.

Abstract: [Authors' Hungarian summary] As a preventive measure against transfusion hepatitis, 182 premature infants were given 8ml/kg gamma globulin during the first transfusion. As controls, 205 premature infants receiving transfusions, and 204 babies receiving various injection treatments but no transfusion, were observed. Hepatitis developed in one case among the group receiving g. gl. and in 15 cases among the group receiving general transfusion. The third group showed no hepatitis. Theoretical explanation for the strong preventive effect of g.gl. is difficult. Further studies are conducted to determine the smallest dose of g.gl. necessary for the preventive effect. 1 Western, 1 Hungarian reference.

"Later Morbidity Conditions of Premature Infants Who Received Large Doses of Gamma Globulin."

Budapest, Orvosi Hetilap, Vol 107, No 44, 30 Oct 66, pages 2086-2087.

Abstract: [Author's Hungarian summary] A follow-up study of premature and full term infants who received 0.8 ml of gamma globulin per kg of body weight led to the conclusion that the number of diseases incurred by them was largely comparable to that of the controls. The lessened need for the use of more potent drugs and the more rapid weight gain in the group of low weight infants should still be credited to the effects of gamma globulin, however. 10 Hungarian, 8 Western references.

Prague, Ceskoslovenska Fysiologie, Vol 15, No 5, Sep 66, pp 366-367

Abstract: Errors occurring in work with C^{14} forming organics that are subject to decomposition are discussed. This decomposition may be caused by the radiation of the C^{14} itself, or by microorganisms. The best protection is to store organic substances in sealed glass containers under refrigeration. The author also describes the design of an apparatus which he invented for wet combustion of C^{14} ; the combustion is conducted under pressure. This prevents inleakage of CO_2 from atmosphere. The author describes further an instrument which he designed for the preparation of precipitates of $BaC^{14}O_3$. No references. Submitted at 3 Days of Physiology of Domestic Animals at Liblice 9 Dec 65.

AUTHOR: Bartoš, F. (Olomouc)

TITLE: Square-law B rectification with transistors

PERIODICAL: Hochfrequenztechnik und Elektroakustik, v. 71, no. 2, 1962,
41-47

TEXT: The author investigated transistor circuits. On the basis of the nonlinearity of the transistors which occurs during voltage control, transistor-B-push-pull circuits were developed which have good squaring properties and offer special advantage for mobile measuring instruments. Operating without thermostat they are far more economical than crystal diode circuits; they are very efficient and their output is high direct voltage. Because of the large squaring range they are suitable also for measuring voltages containing extreme peaks. They may be used in RMS-meters, wattmeters, noisemeters and similar measuring instruments. Fig. 3 shows a transistor push-pull circuit with residual-current separation. In order to ensure that each half-cycle of the applied a.c. voltage U_e will be symmetrically squared, P_1 is made as small as possible and the

Card 1/6 3

Square-law B rectification ...

G/009/62/071/002/001/003
B116/B104

symmetry adjusted by it. P_2 serves for increasing the stability of the operating point, which is always kept in B-operation. Fig. 5 shows a transistor push-pull circuit with residual-current compensation. Its advantage over that shown in Fig. 3 consists in omission of the separating diodes, but the doubled temperature-dependence in the collector circuit is a drawback. The potentiometer P_3 allows perfect adjustment of the residual current compensation. Instead of P_3 it is possible to use an NTC resistor. Transistors having a satisfactory bend of the input characteristic in the upper modulation range are suitable for the squaring circuits shown. Consistently with the cutoff frequency of the paired transistors it would be possible, apart from d.c. voltages, to cope with quasisteady h-f processes also. Temperature compensation is obtained by means of the NTC resistors. A squaring range of up to 32 dB is achieved by means of the transistor squaring circuits. The absolute measuring error related to the input voltage amounts to only 1.5 dB within a temperature range from -10°C to $+40^{\circ}\text{C}$. The stability is adequate but a compromise has to be made between sufficient stability and either the deviation or the effective range of the squaring characteristics. Transistor squaring circuits are simple, of low power, reliable, and can practically be immunized against the effects of ambient temperature. Professor W. Reichardt, Doctor of Card 2/0 \rightarrow

 Fodder Beet Roots (*Beta vulgaris* L. var *rapa* f.
 lutea).
Orig. Pub. : Ceskosl. biol., 1958, 7, No 2, 162-165
Abstract : Giant cells (GC) formed by the authors in the
 explants of fodder beet roots, contain 3-8
 nuclei surrounded by cytoplasm. In the opinion
 of the authors, multinucleic GC may self-
 generate in the cultures of plantal tissue. A
 further division of nuclei in GC was not observ-
 ed. Apparently, the process of formation of
 phragmoplasts and septa is disrupted in GC. --

TITLE: Role of the cytocenter in amitosis

22

SOURCE: Biologia, no. 11, 1965, 873-876

TOPIC TAGS: cytology, animal, biologic reproduction, cell physiology

ABSTRACT: The author conducted experiments with frogs *Rana esculenta* L. and *Rana temporaria* L.; a microscope cover glass was introduced into the dorsal lymphatic pouch of the animals and the cells caught on the glass were fixed and studied. The role of cytocenters in the amitotic partition of nuclei was investigated. Only in some cases was the cytocenter in the proximity of the nucleus undergoing the division; in cells containing several nuclei amitosis takes part in a different area of the cell than the area in which the cytocenter is located. It seems therefore that there is no direct connection between the cytocenters and the division of the nuclei. Orig. art. has: 2 figures. [JPRS]

2902. (750) EXPERIMENTAL OBSERVATION OF WIRE CERCLAGE OSTEO-SYNTHESIS, WITH SPECIAL CONSIDERATION OF THE FORMATIVE EFFECT OF THE COMPRESSION FACTORS - Experimentelle Beobachtungen über die gedrahtete Osteosynthese mit besonderer Rücksicht auf die formative Rolle der Kompressionskräfte - Bartos G. and Karlinger T. Inst. für Chir. Anat. und Operationslehre, Med. Univ., Pécs - ARCH. ORTHOP. UNFALL-CHIR. 1958, 50/3 (213-221) illus. 9

In experimentally produced fractures of the femur or the humerus in dogs, treated with wire cerclage, a marked cartilaginous callus was observed after 2-4 weeks. It was more pronounced at the periosteum than between the bone fragments. If the forearm or the lower leg of the fractured extremity had been amputated, so that weight bearing was prevented, no cartilaginous callus was found but only young bone substance. It is concluded that it is not the contact compression force of the wire cerclage but the intermittent pull and compression and the shearing force of an unstable fracture which account for the formation of cartilaginous callus.

"Use of Blood-Stilling Gelatine Sponges in Loose Vascular Prosthesis."

Budapest, Kísérletes Orvostudomány, Vol XV, No 3, June 1963, pp 225-229.

Abstract: [Authors' Hungarian summary] Loose vessel substitution tubes have the disadvantage of a significant loss of blood during insertion and the possibility of later hemorrhage. The following experiments were conducted by the authors to minimize the disadvantages. Loose, De Bakey prosthesis of great porosity was wrapped into Spongostan-gelatine-sponges. The initial bleeding during surgical insertion of the prosthesis decreased by 30-40 per cent and the danger of postoperative hemorrhage was also reduced. The authors recommend this procedure in the clinical use of vessel substitutes with unknown permeability. With the application of the above technique, the possibility of further structural development of tubes for vessel substitution is also discussed.

"ECG, PCG and Electromanometric Studies in Experimental Mitral Insufficiency"

Budapest, Kiserletes Orvostudomany, Vol 18, No 6, 1966; pp 663-668.

Abstract: On the basis of animal experiments the ECG changes developing in acute mitral insufficiency are described. On the basis of phonocardiographic and electromanometric data three groups may be distinguished: mild, moderately severe and severe. The data obtained in medium severe and severe syndromes are characteristic, and occasionally the changes may be expressed also by means of formulas. 29 references, mainly Western. "Partial Heart-Muscle Replacement by Means of Plastic-Patch Graft"

Budapest, Orvosi Hetilap, Vol 19, No 5, Oct 66; pp 303-306.

Abstract: Authors experimented with the plastic tissue of the Hungarian vascular prosthesis, Terital, for the replacement of the right ventricular wall (patch graft) of dogs. They found that the incorporation of the plastic was histologically identical with that of the vascular prostheses. 15 References, mainly Western.

Title : Efficiency of Reflex Klystron

Orig Pub : Slaboproudy obzor, 1957, 18, No 8, 529-532

Abstract : Relations are given for the efficiency of a reflex klystron.
The results of experiments performed on types 723 A/B and
2K25 klystrons are described. The experimental data are
compared with the results of calculations.

TITLE: Determination and Experimental Verification of the Electrical Parameters of the Reflex Klystrons Employed as the Transmitters in Television Relay Stations

PERIODICAL: Československý časopis pro fyziku, 1960, No. 5, p. 395

TEXT: A reflex klystron should have suitable modulation characteristics if it is to be successfully employed in the transmission of television signals. It is shown that the required modulation curve in a klystron can be obtained by suitable choice of the load connected to the resonant cavity. The maximum permissible distortion is determined and its dependence on the quality factor of the resonator is investigated. It is found that the slope of the modulation curve increases with the oscillation mode and decreases with the increasing quality factor of the resonator.

Determination and Experimental Verification of the Electrical
Parameters of the Reflex Klystrons Employed as the Trans-
mitters in Television Relay Stations

The deviation of the oscillation frequency of the tube, due to
an external load, is found to be one of the very important
parameters. This effect can be investigated experimentally
by measuring the tube when cold and under actual operating
conditions. X

"Direct Revascularization of Myocardium Following an Experimental Infarct in Dogs"

Prague, Casopis Lekaru Ceskych, Vol CII, No 26, 28 June 63,
p 125.

Abstract: Experiments lead to the following conclusions:
1. Anastomosis between the system and coronary artery is feasible even with a pulsating heart. 2. Infarct-like changes were observed following the tying of r. interventricularis. A partial adjustment took place following anastomosis. 3. Microscopic examination showed ischemic deposits in dogs with anastomosis

p 725.

in contrast to large infarcts in dogs without anastomosis.
4. A sudden inflow of blood into the ischemic deposit may be
accompanied by an immediate fibrillation of chambers. It can
be prevented by a temporary interruption of the blood flow
by means of anastomosis and its slow and interrupted liberation.

TITLE: Discretely controlled analog memory 160

SOURCE: Slovenska akademia vied. Ustav mechaniky a automatizacie. Vyskumne problemy technickej kybernetiky a mechaniky (Research problems in technical cybernetics and mechanics). Bratislava, Vyd-vo SAV, 1965, 21-32

TOPIC TAGS: analog memory, digital analog conversion, algorithm, digital information recording, memory element, *analog computer, digital analog converter*

ABSTRACT: The article describes a discretely controlled analog memory device. It deals with the principle of operation based upon digital-to-analog conversion, the mode of digital information recording, the algorithm of controlling the record and the reading of digital information, the automatic signaling of the end of digital-analog conversion

Card 1/2

L 44109-66

ACC NR: AT6023972

and the zero-setting of the previous record. The record based upon a minimal number of memory elements and the mode of signaling the end of conversion derived from the length of information record, are solved in the original way. Conversion time is 300 msec, zero-setting of previous analog value is 200 msec, duration of storage time for new analog value is arbitrary. Analog value may reach $0 - \pm 10$ v or $0 - \pm 100$ v, accuracy .1%, polarity is determined by special bit in the digital information. Orig. art. has: 4 figures and 1 table.
